

A CLOUD Company

protecting your critical enterprise data

BRAaS

Backup & Recovery as a Service

The risk of a company going into liquidation as a result of their data loss is more than 90%.

Backup & Recovery as a Service (BRaaS)

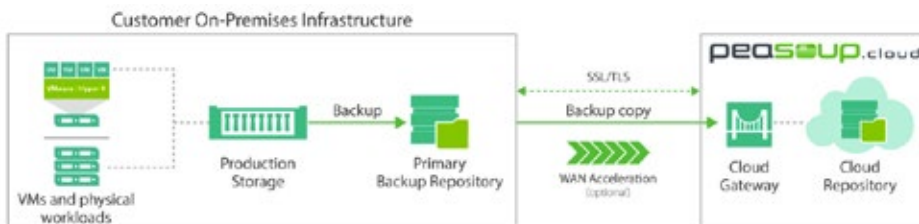

Backup & Recovery as a Service (BRaaS) protects businesses against user and software errors, hardware failure, any security breaches, malicious deletion, theft and cybercrime, and natural or technology disasters.

Traditionally, backup was performed on-premises by the IT department usually by tape or hard drives. Instead of worrying about rotating and managing tapes or hard disks at an offsite location, data storage administrators can offload company's internal data to a secure cloud provider.

Business benefits

PeaSoup's Backup service creates consistent, image-level backups of running VSS-aware applications, such as Microsoft Active Directory, SQL Server, Exchange and SharePoint using proprietary, application-aware image processing. You get transactionally consistent backups of both Microsoft Windows and Linux, which ensure successful recovery of business-critical data, applications and services, and allow for application-specific restore scenarios.

- Ease of recovery - in case of data loss all backups are available and easily located via a user-friendly console. BRaaS allows you to store multiple copies of data in different locations, independent of each other, if data is lost or deleted.
- Increased safety - all the data stored in the BRaaS which minimises the risks of hacking, user errors or natural disasters.
- Cost reduction - BRaaS is less expensive than the cost of tape drives, servers, or other hardware and software elements necessary to perform backup. BRaaS as an automated process also reduces the cost of administration/management.
- Governance, risk & compliance - BRaaS reduces the risk of data loss, lowers compliance costs and improves data governance. BRaaS can help companies with GDPR compliance and data retention requirements as defined by regulatory bodies.
- End-to-end encryption – enhanced security with AES-256 encryption on data transfer and storage. The encryption keys are held and controlled by you, implemented without negatively impacting performance or compression.

PeaSoup BRaaS

- Easy to deploy and low-cost solution, costs are per GB.
- Air-gapped protection to protect from ransomware encryption, viruses and malicious deletion of data including internal backups.
- Additional temporary backup quota increases with no additional charges, to ensure the backups run successfully and comprehensively.
- Applies to the 3-2-1 rule (3 copies of data over two different systems with one off-site).
- Backup copy to a dedicated PeaSoup datacentre, fully compliant to the Government data protection guidelines.
- Full visibility and control of the offsite backups from your local Veeam console.
